Read this first.
Install takes two minutes.

Your Mac will show a warning the first time you open Seene. That is **expected** — this is a private beta that hasn't been through Apple's public review yet. Follow the six steps in this guide and you'll be running in a couple of minutes.

EXPECTED WARNING | ONE-TIME SETUP | NOTHING IS BROKEN

YOU'LL NEED

- A Mac with **Apple silicon** (M1 or newer). Not sure? Apple menu → About This Mac → *Chip*.
- About **6 GB** of free disk space.
- Your administrator password (to install).

DAVINCI RESOLVE

Works with **DaVinci Resolve Studio or the free version** — your synced project is built for you either way. The first time, macOS asks you to allow Seene to control Resolve (see step 6).

IN THIS FOLDER

Seene_v2_Mac_Installer.pkg — the installer. Open this one.
READ FIRST - Install Guide.pdf — this guide.
Install steps.txt — the same steps in plain text, handy to copy.

1 · Open	2 · Allow	3 · Install	4 · Launch	5 · Agree	6 · Drop
the installer	in System Settings	Seene	from Applications	to the NDA	a card

Open the installer

Apple doesn't recognise Seene yet, so it asks you to confirm. You do this once.

1 Double-click `Seene_v2_Mac_Installer.pkg`

macOS says it **can't verify** the file. Click **Done**. **Do not** click "Move to Trash".

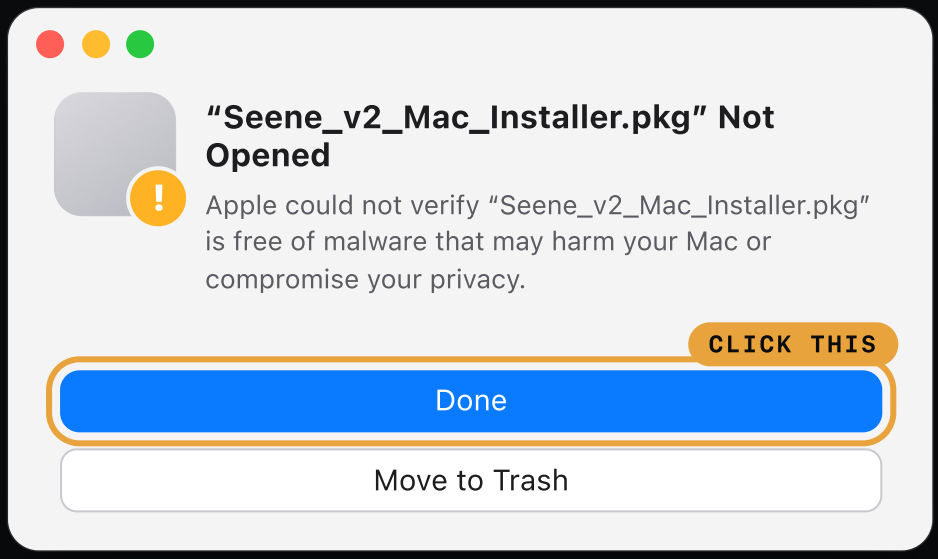

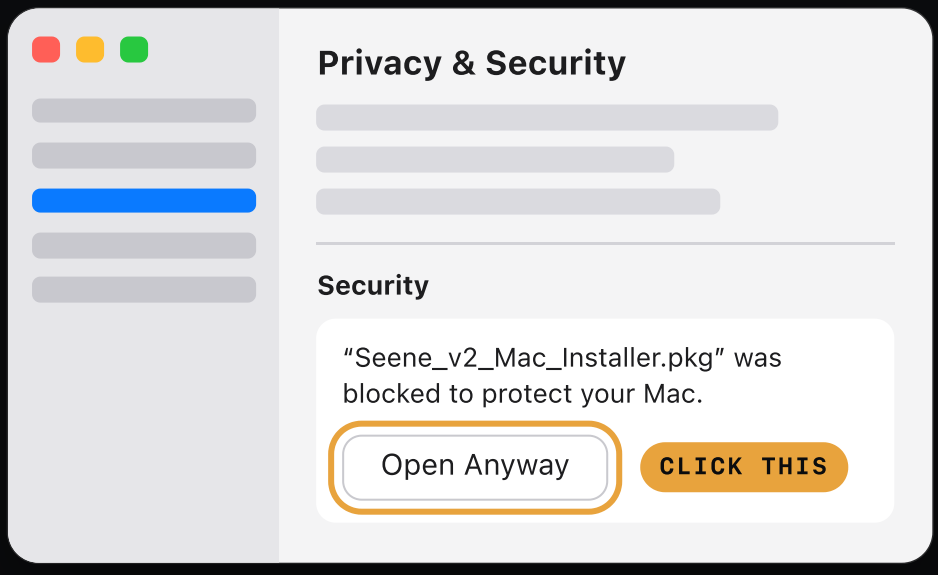

ILLUSTRATION · WORDING VARIES SLIGHTLY BY MACOS VERSION

2 Open System Settings → Privacy & Security

Click the Apple menu → **System Settings** → **Privacy & Security**. **Scroll all the way down** to the "Security" section. You'll see a message about the installer and a button — click **Open Anyway**, then enter your password or use Touch ID.

ILLUSTRATION

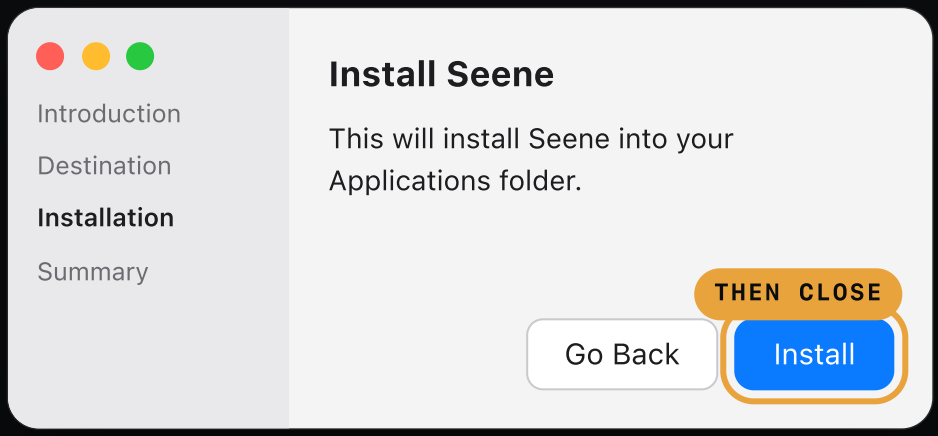

> **Don't see "Open Anyway"?** It only appears **after** Step 1 and stays for about an hour. Go back to Step 1, double-click the installer again, then reopen Privacy & Security.

Install and launch

Standard macOS installer — it replaces any older Seene automatically.

3 Click through the installer

Choose **Continue**, then **Install**, and enter your password when asked. When it says the installation was successful, click **Close**. If you have an older Seene, it's removed for you.

ILLUSTRATION

4 Open Seene from your Applications folder

Open **Finder → Applications → Seene** (or find it in Launchpad). It should open **without a second warning** — the installer takes care of that for you.

> **If macOS still blocks the app,** there's a one-line fix. Open **Terminal** (press ⌘+Space, type "Terminal", press Return), paste the line below, press Return, then open Seene again.

```
$ xattr -dr com.apple.quarantine /Applications/Seene.app
```

COPY THIS EXACTLY · IT ONLY UNLOCKS SEENE, NOTHING ELSE ON YOUR MAC

i Why does this happen?

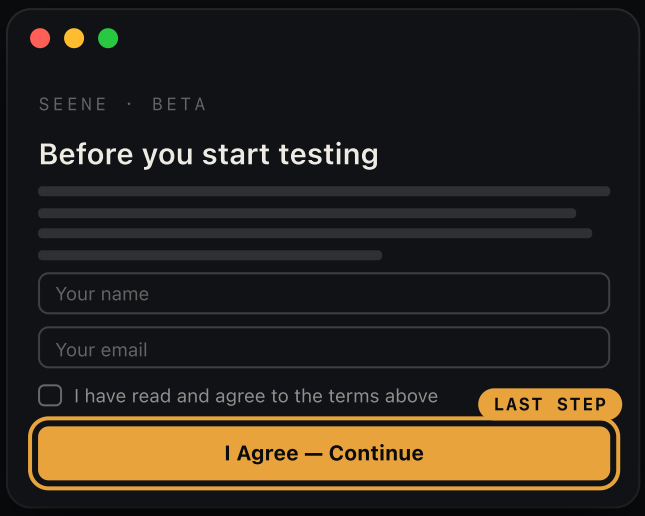

Apple asks developers to register and have each app reviewed before it can open with no warning. Seene is a private beta shared with a small group, so it hasn't been through that yet. The warning is about **Apple's review status**, not a problem found in the app.

First run

You're in. Here's what you'll see.

5 Agree to the beta NDA

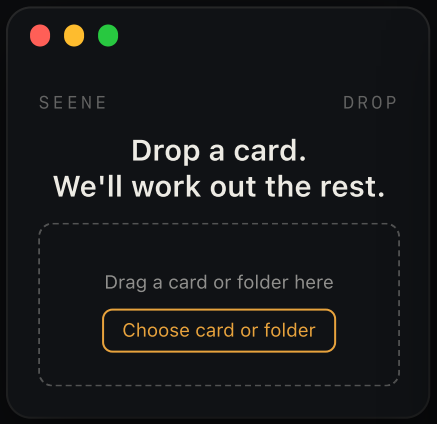

The first time you open Seene it shows a short confidentiality agreement. Read it, enter your **name and email**, tick the box, and click **I Agree — Continue**. You only do this once on each Mac.

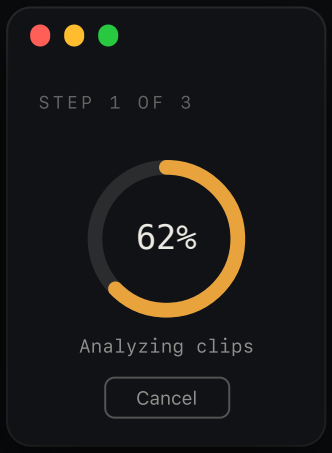

ILLUSTRATION

6 Drop a card and let it work

Click **Choose card or folder** (or drag your card in). Seene reads your slates, matches the audio and shows progress. **Cancel** is there if you want to stop. When it finishes, it opens your new synced project in DaVinci Resolve (Studio or Free).

1 · DROP

2 · ANALYZE

First time only — allow Seene to control Resolve. If macOS or Seene asks, open **System Settings → Privacy & Security → Accessibility**, switch **Seene** on, then click Open in DaVinci Resolve again. If Resolve was already open, Seene may ask you to quit it (⌘Q) once and try again.

Keep your Mac awake and plugged in during big cards. Please don't click around in DaVinci Resolve while Seene is building your project.

If something goes wrong

The most common hiccups, and the fix.

No “Open Anyway” button	Redo Step 1 (double-click the installer), then reopen System Settings → Privacy & Security and scroll to the bottom. The button shows for about an hour after each attempt.
The installer says it's damaged or can't be opened	The download may be incomplete. Download it again and compare the file size with what you were told.
Seene is blocked after installing	Run the one-line Terminal command from Step 4, then open Seene again.
A card seems stuck	Click **Cancel** and run it again. Big cards can take a while — if there's still no movement after a long time, tell us the card size and what the progress text says.
Seene asks for permission to control Resolve	Open **System Settings → Privacy & Security → Accessibility**, switch **Seene** on, then click Open in DaVinci Resolve again. This is only needed once.
Seene asks you to quit and reopen Resolve	The first time, Seene installs a small helper that Resolve only loads at startup. Quit Resolve completely (⌘Q), then click Open in DaVinci Resolve again.
Resolve doesn't open your project	Make sure DaVinci Resolve (Studio or Free) is installed and not showing a dialog box, then try again.

WHAT SEENE RECORDS

- Your name and email from the NDA
- For each run: card folder name, clip counts, sync results, how long it took
- Your Mac model/macOS version, Resolve version, and an anonymous device ID

WHAT NEVER LEAVES YOUR MAC

- Your footage and audio files
- Anything inside your clips
- Seene reads your files where they are — it doesn't copy or move your footage

Run results are sent to us automatically — there's nothing to export. When you send feedback, just tell us **which step you were on** and what you saw on screen. A screenshot helps a lot.
